Diversity of the genus *Agrilus* Curtis (Coleoptera: Buprestidae) in South AmericaDiversidad del género *Agrilus* Curtis (Coleoptera: Buprestidae) en América del SurGianfranco Curletti¹ ¹c/o Museo Civico di Storia Naturale di Carmagnola, Parco Cascina Vigna, Carmagnola, Italy. E-mail: giancurletti@gmail.comZooBank: urn:lsid:zoobank.org:pub: 9A6C7EA4-047C-4D01-A90F-89AEE5EB82DA
<https://doi.org/10.35249/rche.46.3.20.09>

Abstract. Using an updated checklist of the *Agrilus* species of South America, it is analyzed the status of knowledge of the *Agrilus* fauna for each country on the continent. When the geographical extent of each country and the number of known species are considered, a great disparity of knowledge emerges, with some countries (e.g., French Guyana) being relatively well investigated and others (e.g., Ecuador, Peru, Colombia) for which the state of knowledge is still embryonic. It is therefore reasonable to expect the number of known species will increase greatly as further research is conducted, especially in the latter countries.

Key words: Agrilini, checklist, countries, density, distribution, Neotropics.

Resumen. A partir de una lista actualizada de las especies de *Agrilus* de América del Sur, se propone un análisis del estado del conocimiento de la fauna de *Agrilus* para cada país del continente. Considerando la extensión de los diferentes países y el número de especies descubiertas hasta ahora, surge una gran disparidad de conocimiento, con países relativamente bien investigados (e.g., Guyana Francesa) en comparación con otros para los cuales el estado del conocimiento es incipiente (e.g., Ecuador, Perú, Colombia). Por lo tanto, es razonable esperar un gran aumento futuro del numero de especies conocidas a partir de nuevas investigaciones.

Palabras clave: Agrilini, listado, países, densidad, distribución, Neotrópico.

Introduction

The genus *Agrilus* Curtis, 1825 is one of the most species-rich genera in the entire animal kingdom and occurs on all the continents around the world except Antarctica. Based on data gathered over many years of research and with the help of data kindly provided to me by esteemed colleagues Henry Hespenheide and Eduard Jendek, the number of taxa currently known is estimated at just over 4,000 (Table 1, Fig. 1), number surely conservative. What is most surprising in the study of this vast genus is that its taxonomic knowledge and its numerical consistency are still far from exhausted. In fact, any field research carried out in tropical or subtropical areas or even simply the study of historical museum collections inevitably leads to the discovery of many undescribed species.

Statistical projections conducted on limited regions of the world (Curletti 2006;

Hespenheide 1996; Hespenheide & Chaboo 2015) have hypothesized a significant number of species that are still unknown, up to double or even quadruple the number of currently known species. It follows from the evidence that certain regions of the world are still poorly explored, both in taxonomic and numerical terms.

The intent of this paper is to attempt to establish the state of knowledge of the *Agrilus* fauna in each country of South America and to establish a relationship between the number of taxa present and its geographic extent. To obtain this result, we considered it useful to list all reported taxa.

Table 1. Approximate number of *Agrilus* taxa in the world.

Countries	Taxa
Palearctic	490
Ethiopian	945
Nearctic	200
Neotropical	1430
Oriental	880
Australian	100
Total	4045

Methods and Considerations. Fundamental importance in this study is the Bellamy catalog (2008) which is comprehensive until the year of its publication, both as regards taxa and bibliography. For this reason, the bibliography has been updated by omitting the previous contributions and limited to adding the later ones. In addition to this, the data presented in the following tables are based on the knowledge acquired by years of studies of the taxa in each country. The main purpose is to highlight the current state of knowledge and the degree of knowledge of the *Agrilus* fauna based on the relationship between the number of species and the geographical extent of the country. The absolute numbers for individual countries (Table 2, Fig. 2) can lead to erroneous or meaningless conclusions, as they are subject to numerous variables such as climate, vegetational characteristics, difficulty of access during historical periods, and orography.

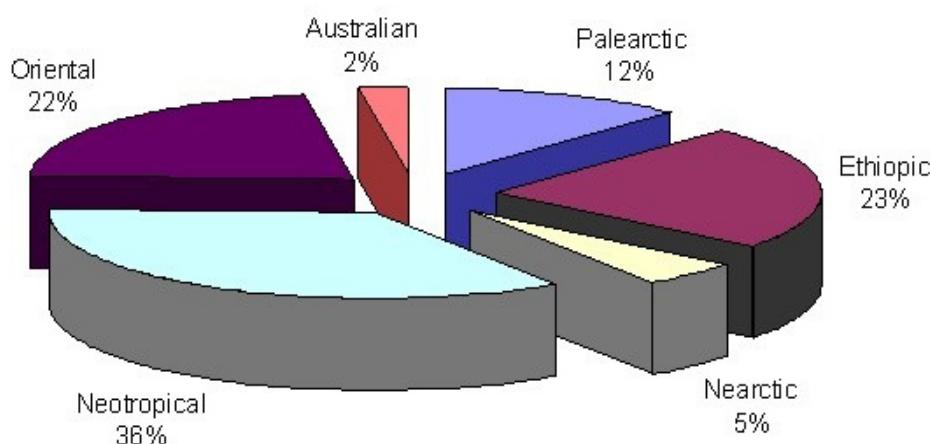

Figure 1. Percentage subdivision of taxa in the Zoogeographic Regions. Neotropics is the richest.

Table 2. Column 1 lists the countries of South America, column 2 gives the surface area of each country in km², column 3 gives the total number of described taxa, column 4 gives the number of synonymized or excluded taxa, and column 5 gives the net number of taxa after excluding the number in column 4.

Country	km ²	spp.	syn.	Tot.
Trinidad & Tobago	4768	13	0	13
French Guyana	83534	155	7	148
Colombia	1142000	34	5	29
Venezuela	916445	26	1	25
Ecuador	283560	9	0	9
Guyana	214969	11	5	6
Suriname	163821	0	0	0
Brazil	8511000	550	57	493
Peru	1285000	34	0	34
Bolivia	1099000	24	2	22
Chile	756950	10	5	5
Paraguay	406752	27	4	23
Argentina	2780000	136	29	107
Uruguay	176215	14	3	11

Orography and latitude. Have fundamental importance, allowing to distinguish tropical and subtropical areas, summarily treated in the discussion.

Vegetation. In particular the presence of forests, is of great importance, but as far as Neotropical *Agrilus* are concerned, many species have evolved away from woody plants and adapted to herbaceous plants—much more so than the African, Palearctic and Australian faunas. Such species are particularly present in savannah (Brazilian Cerrado, Argentine Pampas) or sub-desert areas (Chile and Peru). Hespenheide (1991) noted that leaf-miners (Tracheini) are predominant in southern Neotropical habitats. There are no known *Agrilus* leaf miners; however, an ecological convergence can be seen by the considerable number of stem-boring species that attack living plants, both herbaceous (Fig. 5) and woody. This obviously implies a high percentage of host specificity that, at least in part, explains the difficulty in encountering individuals of these species, in contrast to what occurs in the faunas of other geographic areas. Access to forests has also been a significant factor in faunistic explorations during historical times. For example, during the 18th and 19th centuries, the Brazilian Amazon rainforest remained almost completely inaccessible for research, contrasting sharply with the Atlantic forest. Accordingly, a significant percentage of species described in Brazil (71%) are found in forests along the Atlantic Ocean, while only 6% are from Amazonian forests (Curletti 2018a, 2019).

Territorial dimension. Is the only variable that can be precisely quantified, and it is on this metric that the considerations presented here are based, albeit empirically. While imperfect, it does provide some useful indications on the state of knowledge of the *Agrilus* fauna.

Figure 5. 1. *Agrilus* sp. cfr. *figuratus* Curletti & Brûlé on a rear dune herbaceous plant. Brazil, Bahia (photo F. Albertoni). 2. *Agrilus piscis* Gory on *Senna quinquangulata*. French Guyane, Route de Kaw, PK 37, sur *Senna quinquangulata* (photo S. Brûlé). 3. *Agrilus lupus* Obenberger on *Senna* cfr. *chrysocarpa*. French Guyane, Rés. des Nouragues (photo S. Brûlé). 4. *Agrilus intermixtus* Curletti & Brûlé on *Senna* cfr. *chrysocarpa*. French Guyane, Rés. des Nouragues (photo S. Brûlé). 5. *Agrilus goryellus* Thomson. French Guyane, Route de Kaw, on *Mendoncia hoffmannseggiana* (photo S. Brûlé). 6. *Agrilus trames* Curletti & Brûlé. French Guyane, Rémire-Montjoly, on *Mucuna sloanei* (photo S. Brûlé).

Observations and Conclusions

As can be seen in Table 2 (column 5) and Fig. 2, absolute numbers of taxa suggest that Brazil is the best-investigated country regarding its *Agrilus* fauna, followed by Peru and Argentina. The absolute numbers also suggest that countries with smaller geographical extents and, thus, faunistically poorer such as Trinidad and Tobago, Ecuador, or Paraguay, are less well investigated.

By examining the relationship between known species and geographical extent (Fig. 3), the percentages highlight how French Guyana and Trinidad and Tobago—the latter especially despite fewer total taxa—are notably richer in species and, thus, the best-known faunistically, as confirmed by the contributions of Fisher (1943, 1944) for Trinidad and Tobago and Curletti & Brûlé (2011, 2013, 2014a, 2014b, 2014c, 2015, 2016, 2017, 2018) for French Guyana. In contrast, Brazil, despite more than 540 known species, has not been as well explored faunistically compared to the previous two or Uruguay. For the remaining countries, there are no reports from Suriname and relatively few from Bolivia and Colombia relative to their geographical extent.

These results suggest that nations such as Venezuela, Peru, and Ecuador deserve greater investigation, since they are poorly explored relative to their geographical extent.

Chile represents an exception due to the objective scarcity of species resulting from its relatively cold, desert climate. The data may also be less objective for Argentina (Curletti 2018), since only the northern part of the country has a subtropical climate and the southern part partially shares the Chilean climate, although less so in the eastern part due to the greater distance from the Andes Mountains. The remaining

countries intersected by the Andes Mountains (Peru, Colombia, Ecuador) all have warm-climate rainforests.

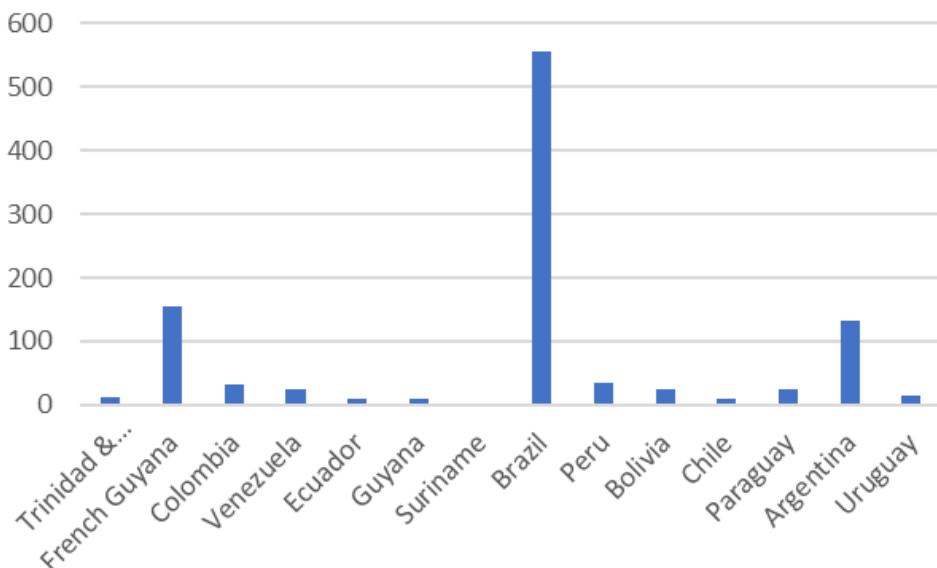

Figure 2. Number taxa /country for South America.

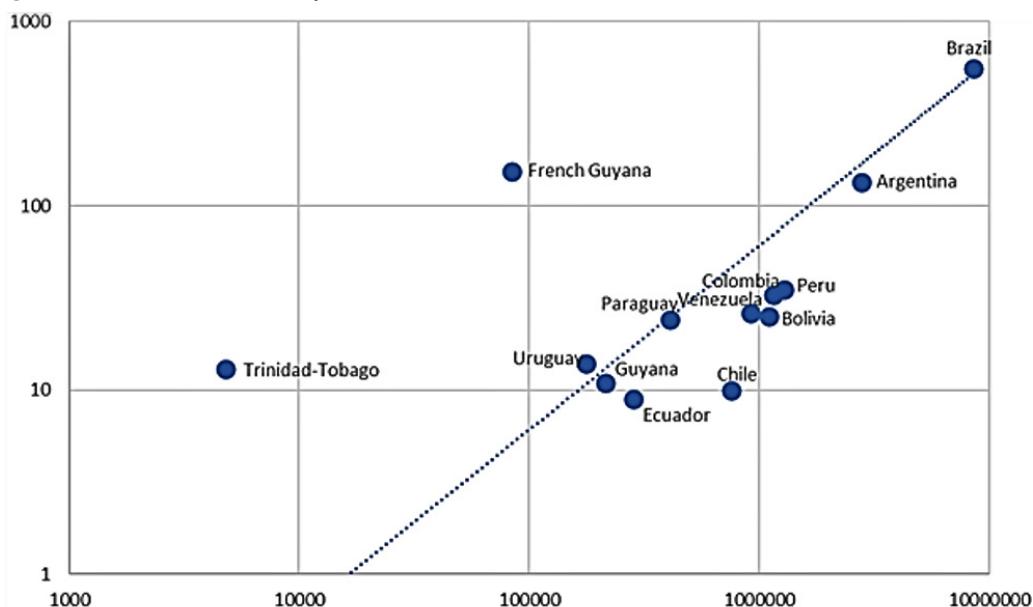

Figure 3. Species/ area curve for *Agrilus* spp. in South America: number of *Agrilus* spp. of countries in South America in relation to their geographical area. The curve is highly likely skewed based on the state of knowledge of the entomofauna of each country and the number of species in countries such as Venezuela, Colombia, Peru and Ecuador will surely increase greatly with further research. Number of species is also greatly influenced by ecological and biogeographical factors such as climate, topography, geographical barriers (mountains and rivers), etc. Looking at the graph, however, it is clear that French Guyana and Trinidad Tobago are differentiated from the average. Brazil has the highest number of species but falls within the average knowledge of other states. On the opposite side is Chile for the reasons explained in the text.

Regarding the study of the genus *Agrilus* in South America (Fig. 4), the greatest interest has occurred from the end of the 19th century through the first half of the 20th century. Most of the progress during these years was due primarily to two authors: Charles Kerremans during the late 1800s and Jan Obenberger during the early 1900s, who have been able to take advantage of research carried out by talented researchers such as Dirings, Mraz, Pereira, Plaumann in Brazil, Peña in Chile. Subsequent to this period there was a sharp decline in research until the present day, which has seen a marked recovery due primarily to the contributions of Curletti and several collaborators, thanks mainly to the collections made by SEAG members in French Guyana and the study of material preserved in the museums of Berlin, Ilha Solteira, Lima, Manaus, Ouro Preto, São Paulo. In addition to these, marginal contributions for taxonomic corrections (Bellamy 1998; Jendek 2001, 2005, 2012).

The enormous amount of material that is awaiting study remains in the European and North American museums, not to mention the university entomological collections scattered in hundreds in the South American countries.

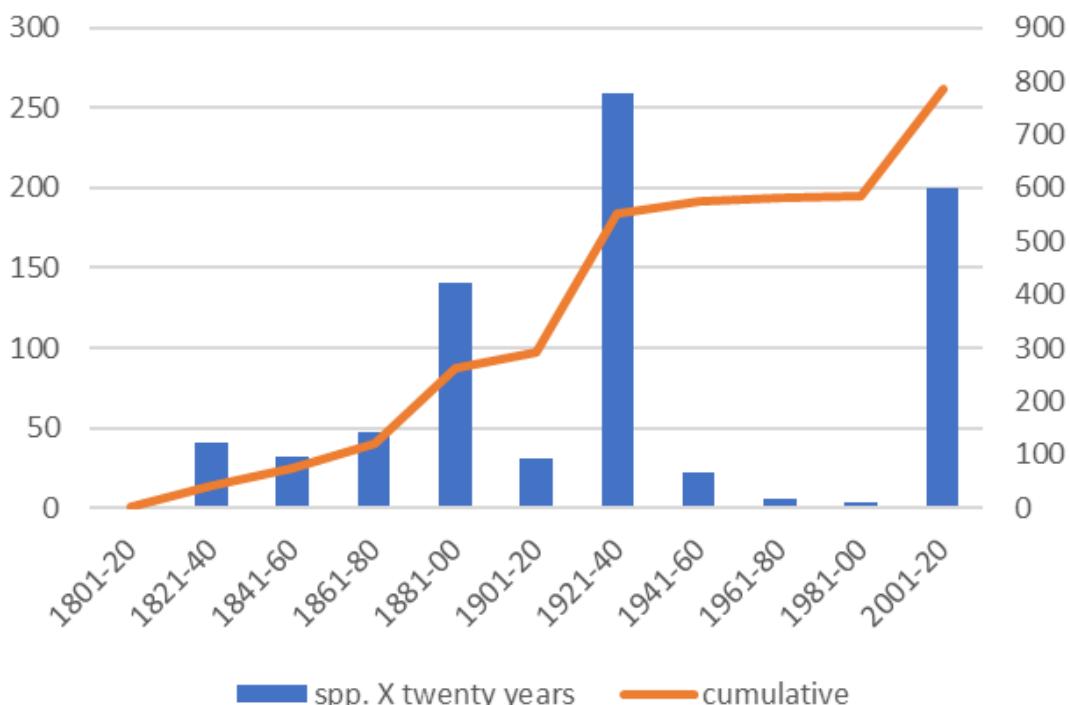

Figure 4. Trend related to the progress on the study of the genus *Agrilus* over the past twenty years. It is evident that the highest activity occurred in the early 1900s due to the contributions of Kerremans and Obenberger. There is a substantial drop in activity afterwards before a renewal of research activity beginning in 2000.

Acknowledgments

I would like to thank colleagues Giovanni Boano, Stéphane Brûlé, Angelo Dutto, Henry Hespenheide and Eduard Jendek for their suggestions, help, collaboration and to Ted MacRae, Letizia Migliore and Cristian Pineda for linguistic help.

Appendix 1. List of known taxa for each country. Generic records such as “South America”, “Tropical America” or “*Agrilus* sp.” were not considered in this list.
